

COORDINATION-TAX DIAGNOSTIC

Seven signs you are paying a coordination tax

The cost rarely appears as one line in the P&L. It appears between people, tools and decisions.

02 / 8

01 / Decisions queue behind the same person

Work pauses while teams wait
for context, approval or
judgment that exists in only
one head.

03 / 8

02 / Follow-up depends on memory

The workflow has no reliable trigger, owner or escalation path. Progress depends on somebody remembering.

04 / 8

03 / Every handoff rebuilds context

Teams translate the same brief, customer history or decision repeatedly because the system does not carry it forward.

05 / 8

04 / Another tool creates another inbox

The software may be useful,
but nobody redesigned how
work should move through it.

06 / 8

05 / Meetings are the integration layer

People meet to reconcile systems, clarify ownership and manually route work that should already know where to go.

07 / 8

06-07 / Exceptions become normal work

Escalations consume senior attention, and growth creates more coordination instead of more capacity.

08 / 8

Measure the drag before automating it

Start with one workflow. Find the waiting, rework, chasing and decision latency. Then redesign the movement.

RUN THE 90-SECOND DRAG CHECK
