

GOVERNED DECISION BOUNDARIES

What should an agent be allowed to do?

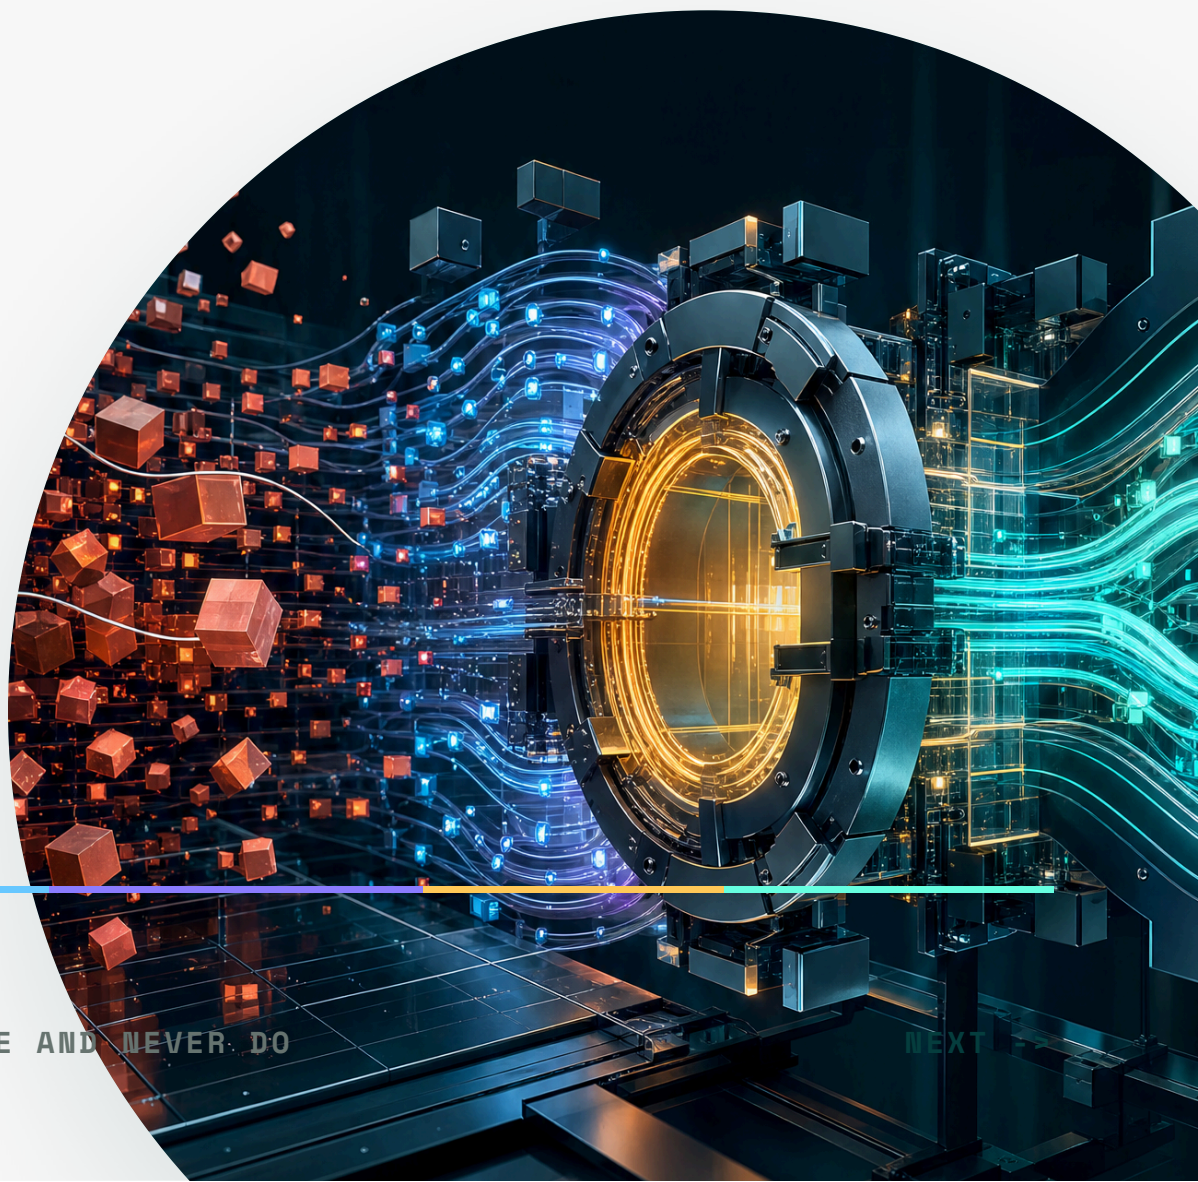

Autonomy is useful only when the authority boundary is explicit.

02 / 8

Decide

Routine, reversible actions
inside an agreed policy:
classification, routing,
reminders and low-risk
preparation.

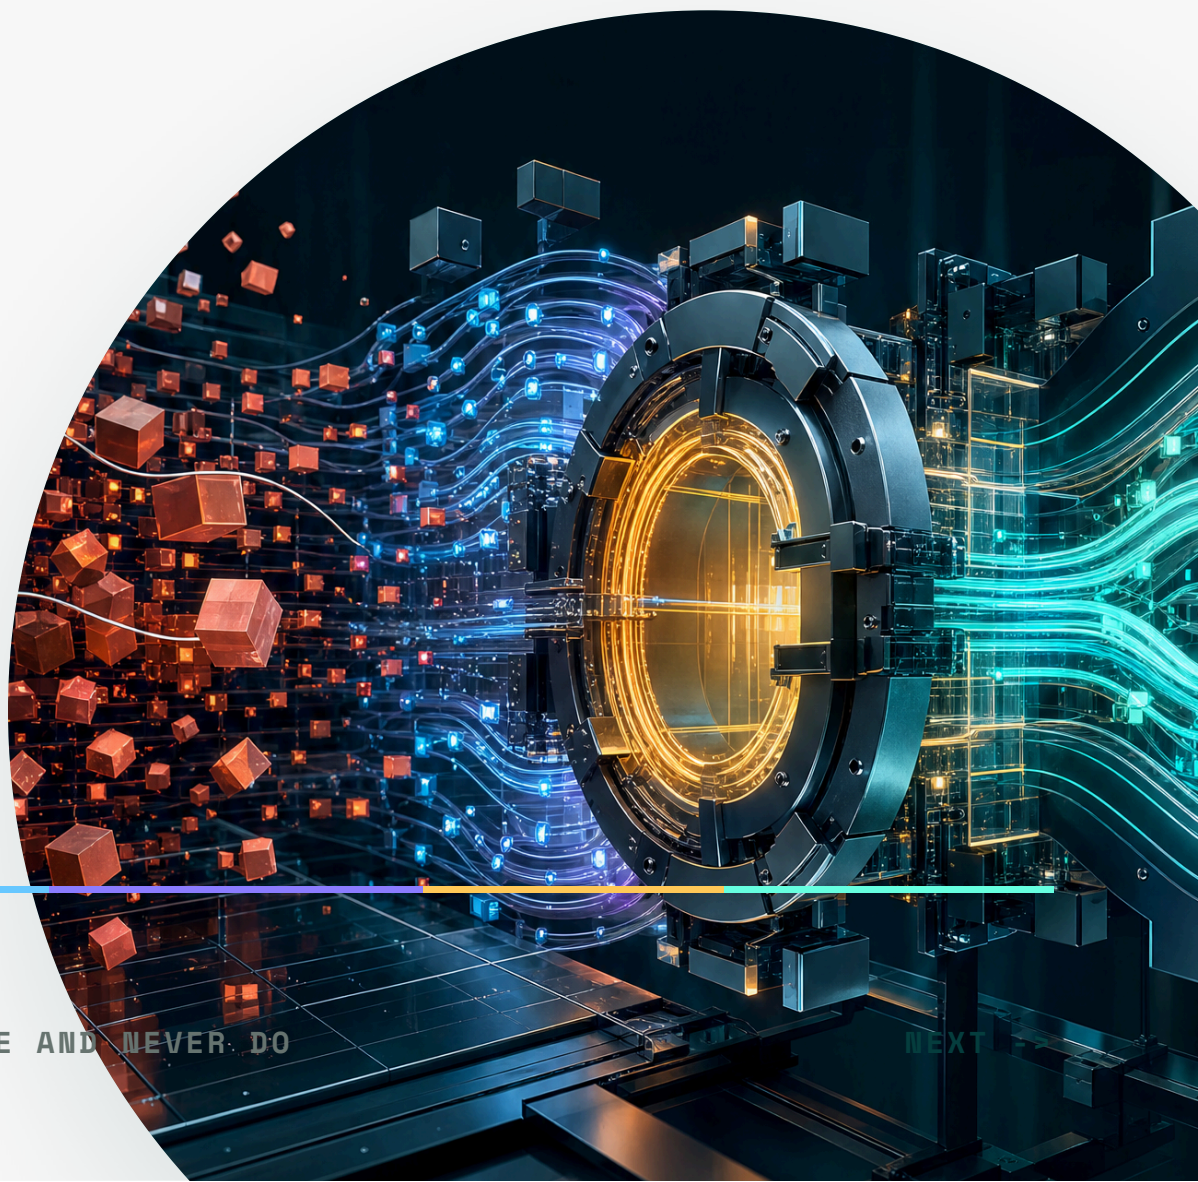

03 / 8

Recommend

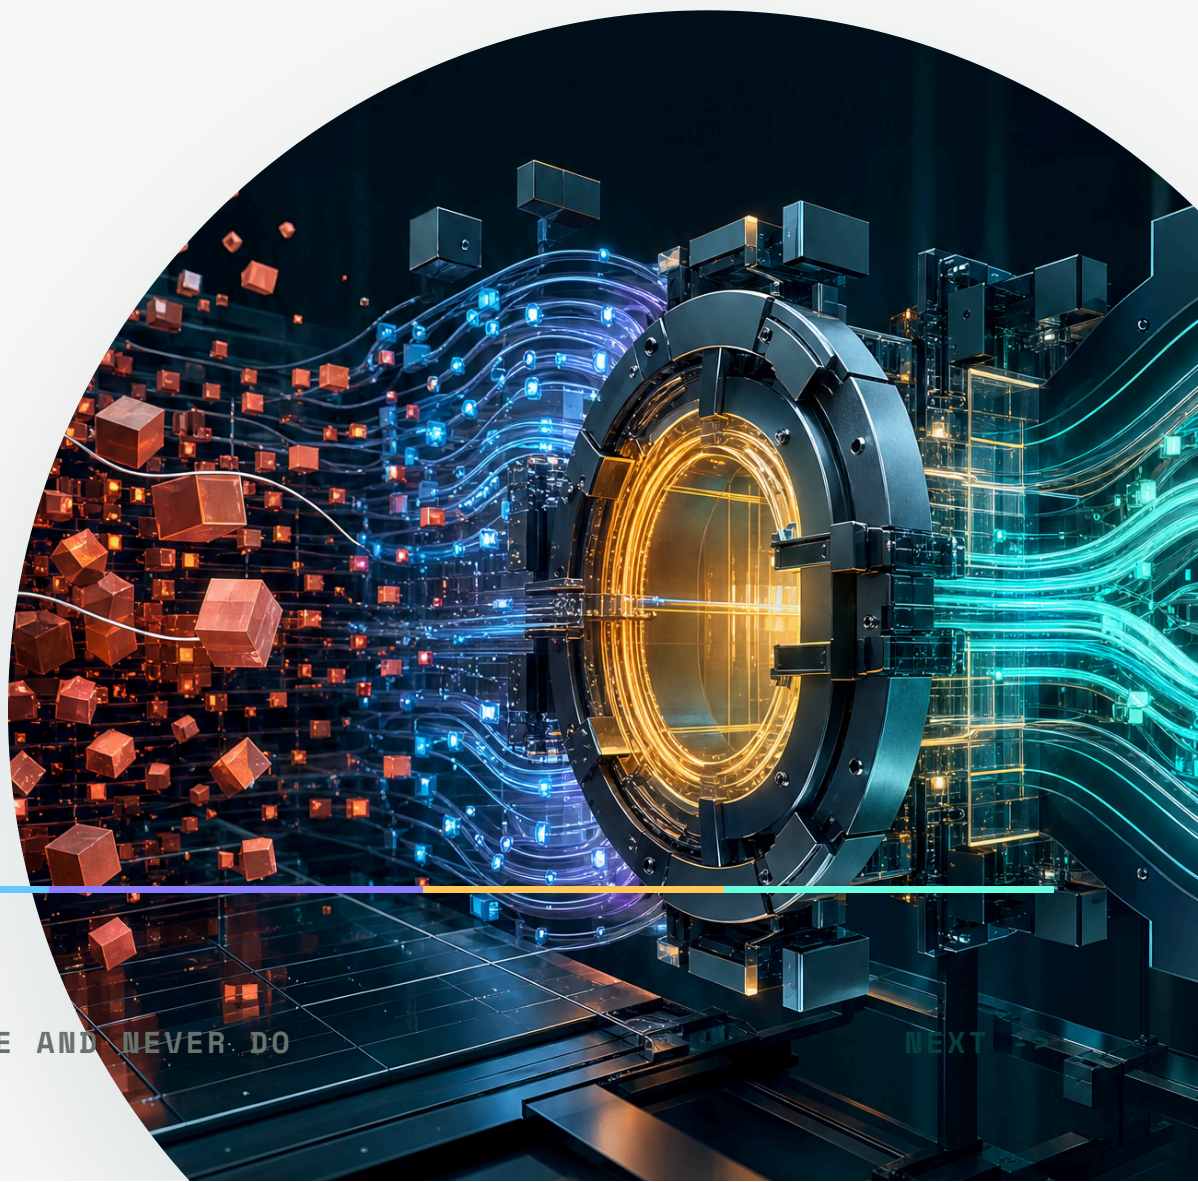

Judgment calls where the agent can assemble evidence and propose a next step, but a human owns the decision.

04 / 8

Escalate

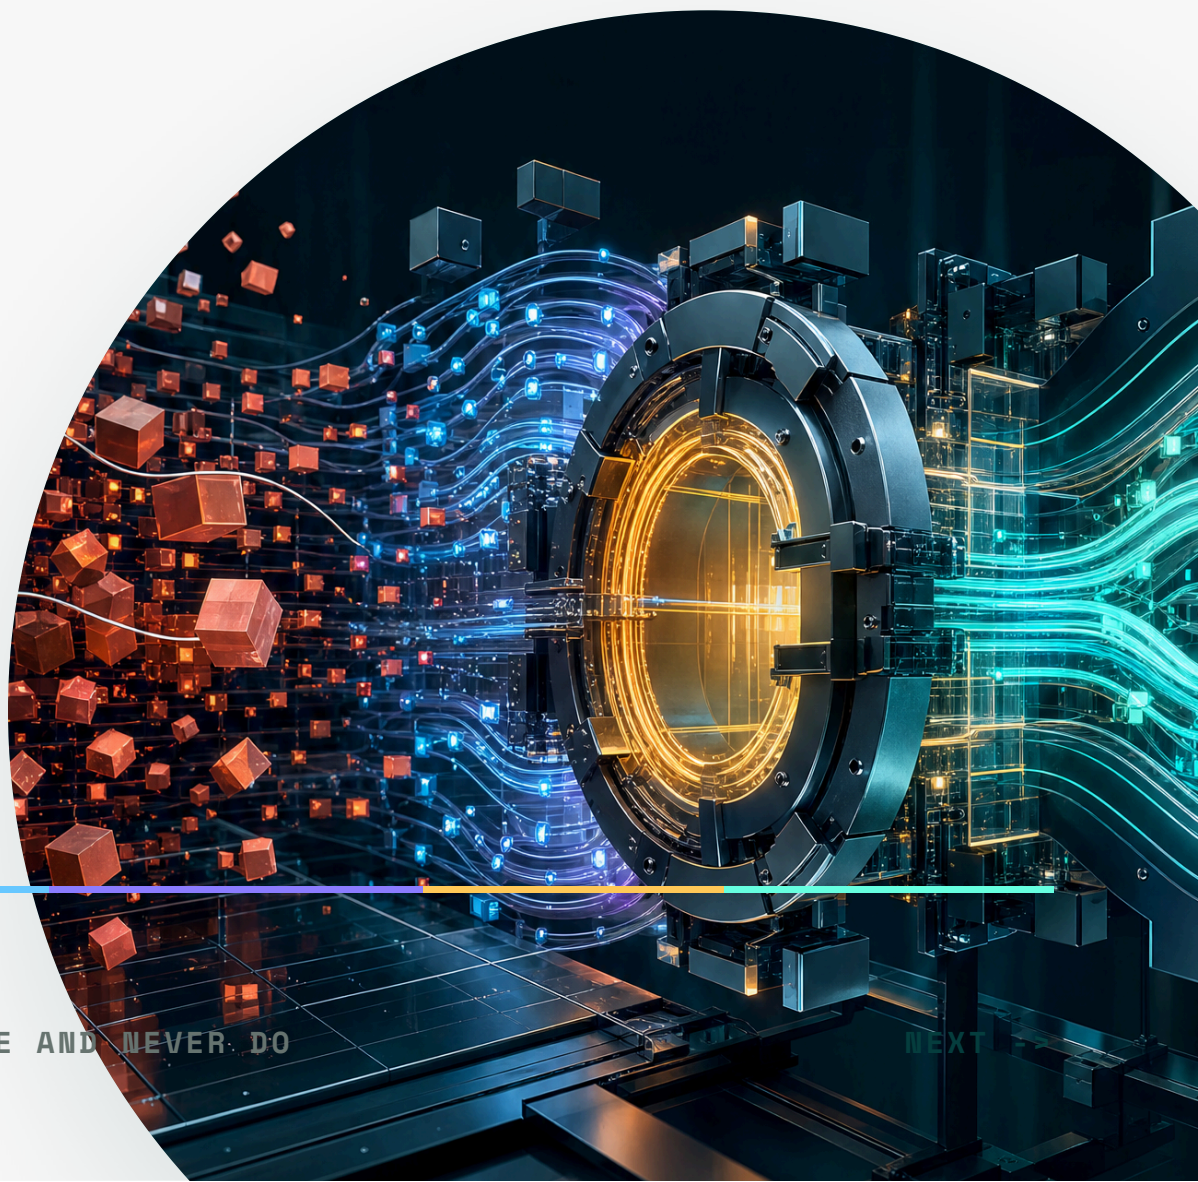

Exceptions, ambiguity, missing evidence or thresholds that require accountable human attention.

Never do

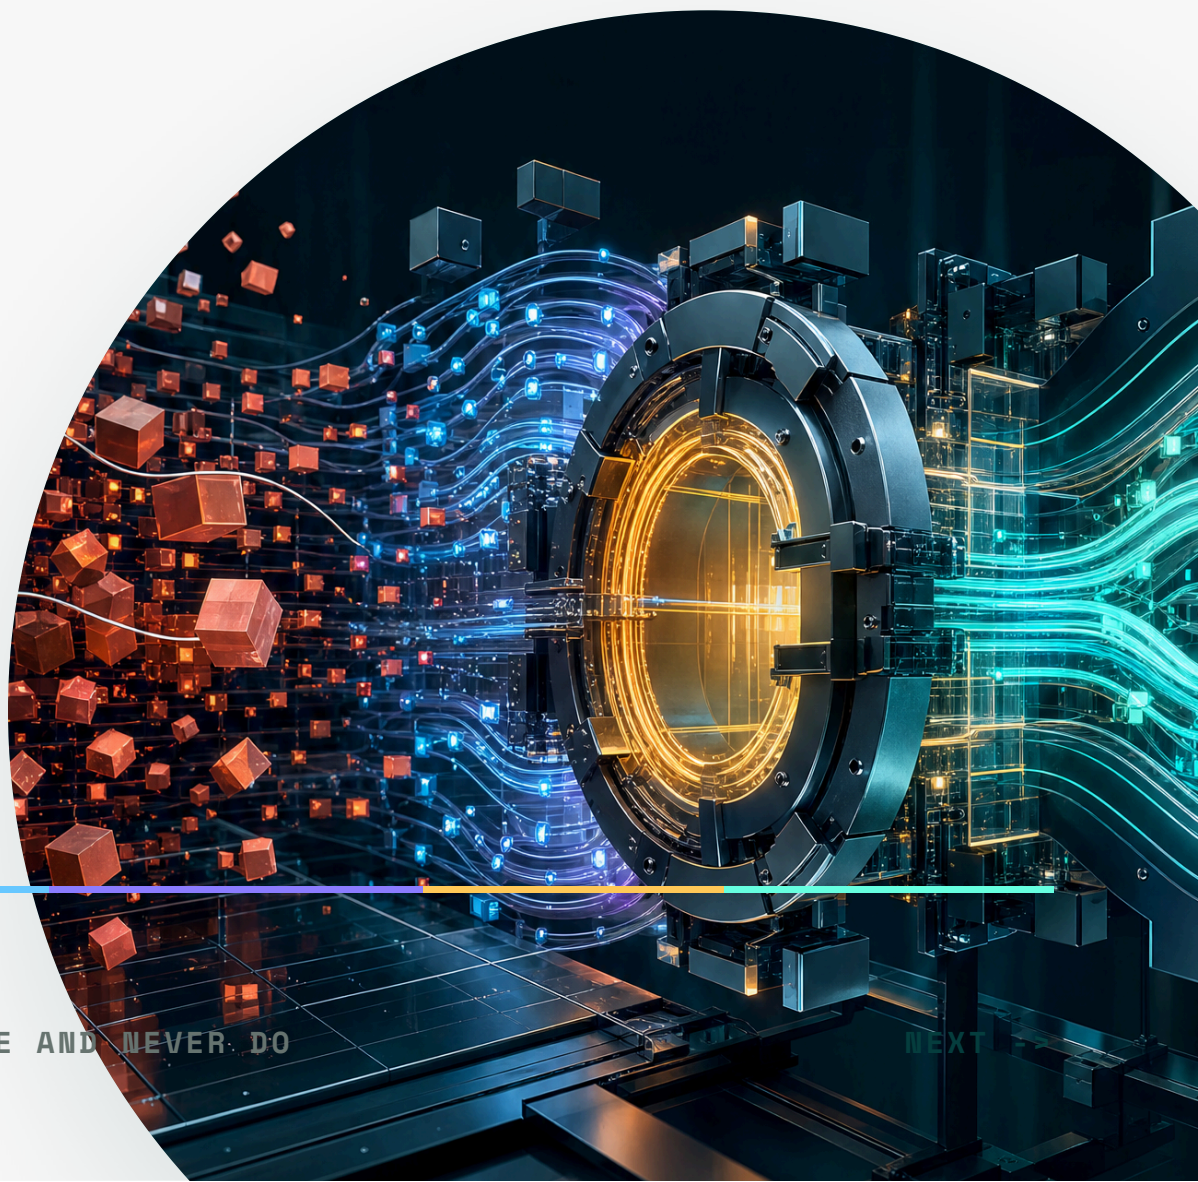

Spend, publish, alter
credentials, mutate protected
records or make consequential
external commitments without
explicit authority.

Carry the decision context

An escalation should arrive with the source, options, risk and reason, not as another vague notification.

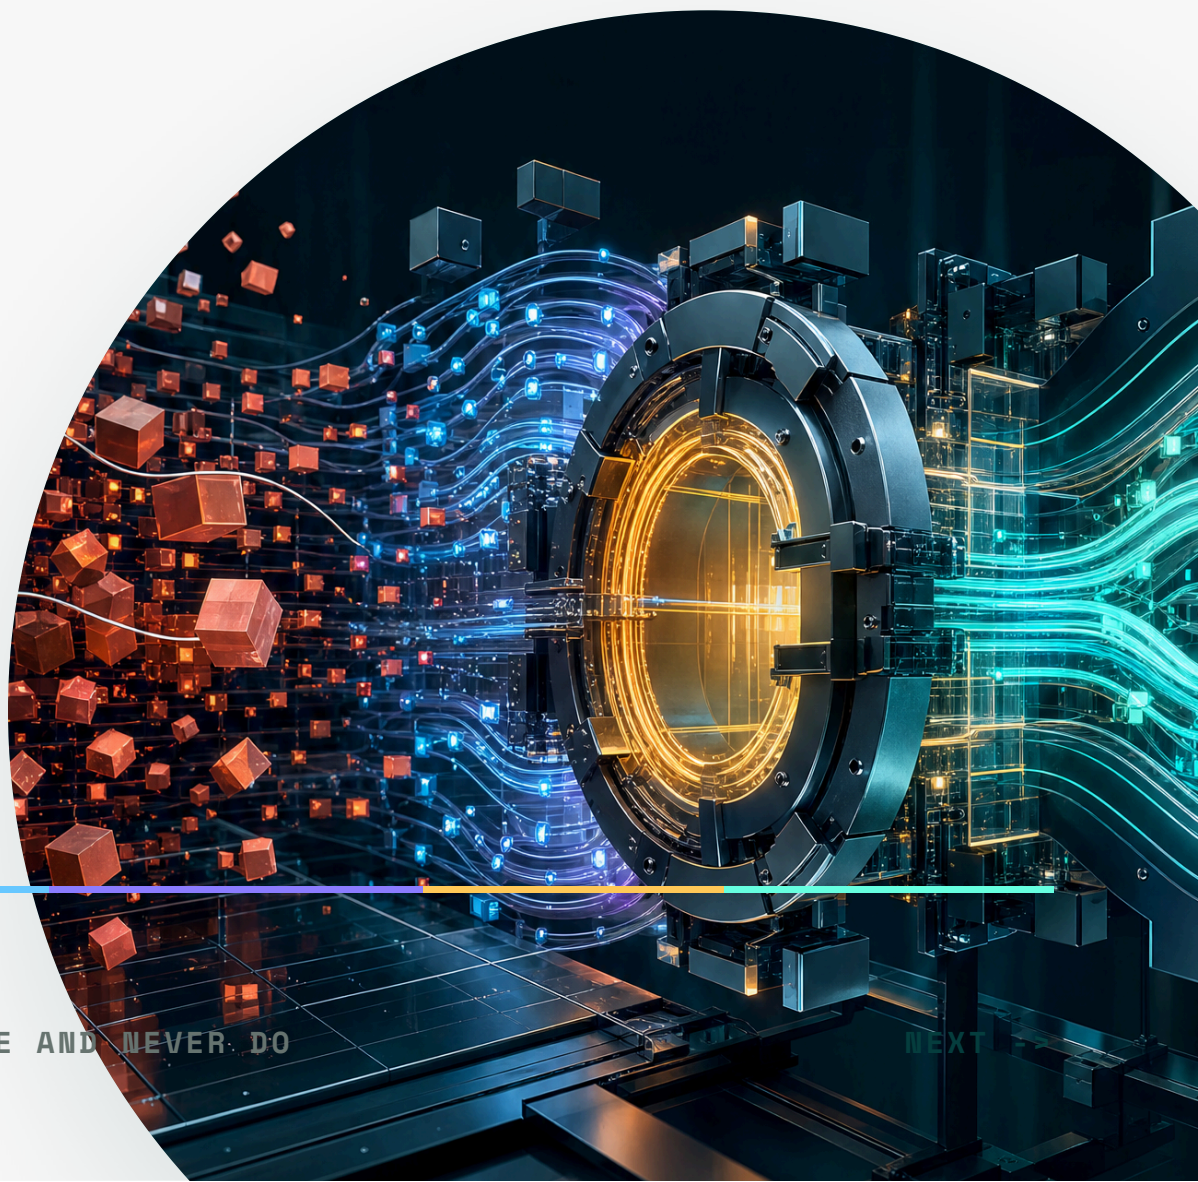

07 / 8

Log what happened

A governed system makes actions, approvals and exceptions reviewable after the fact.

08 / 8

Good governance reduces friction

The goal is not a human approval on everything. It is the right human decision at the right boundary.
